# Why is identifying mergers hard?

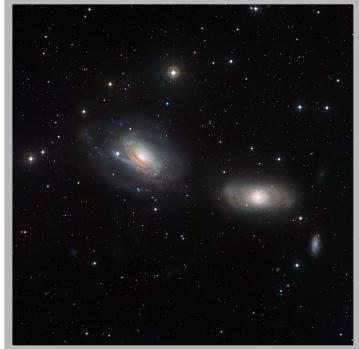

# Why is identifying mergers hard?

There are many different types and stages of mergers and they all look different observationally.

# Why is identifying mergers hard?

Close pairs

Interacting

Coalescence

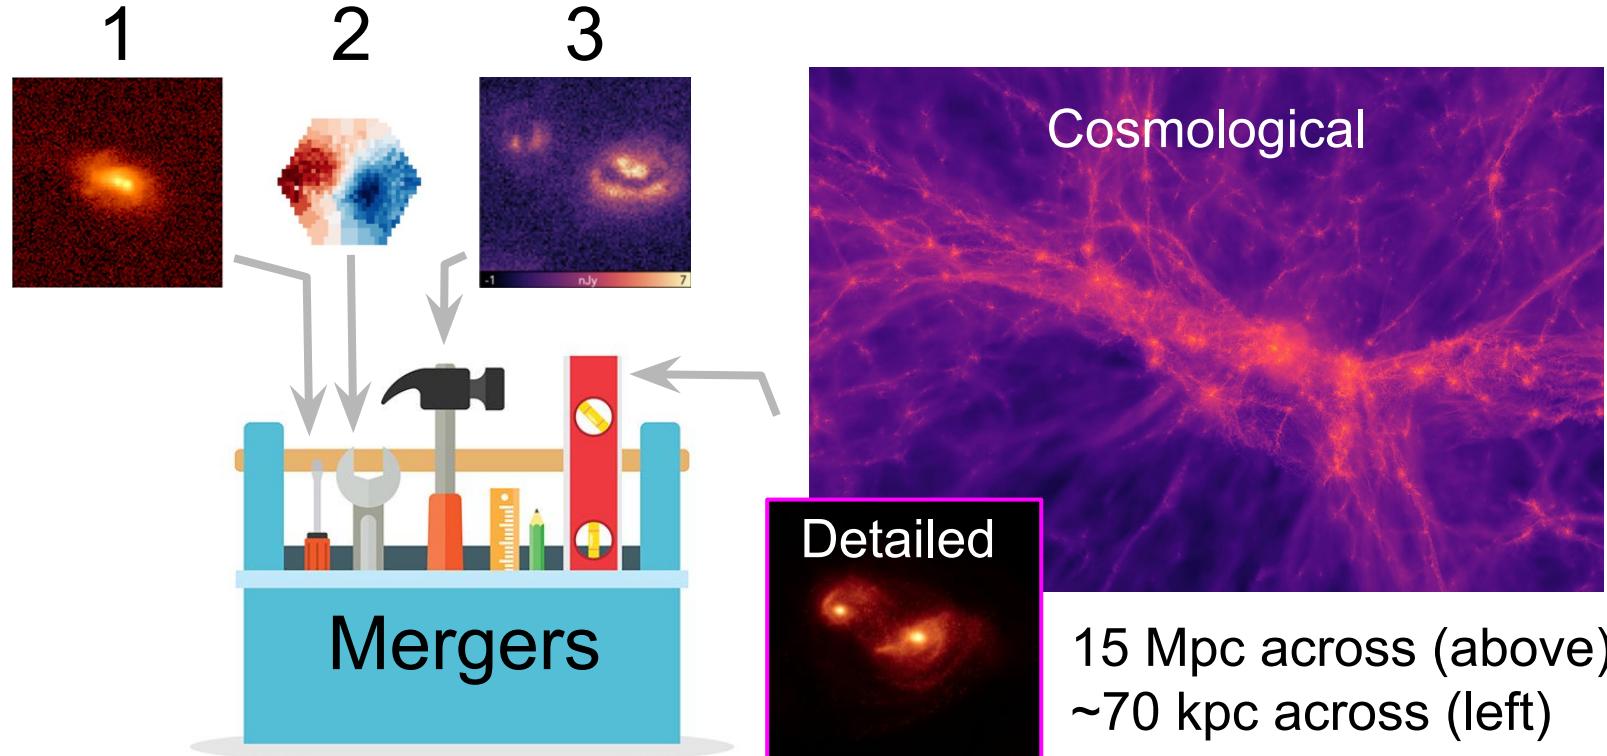

Post-merger

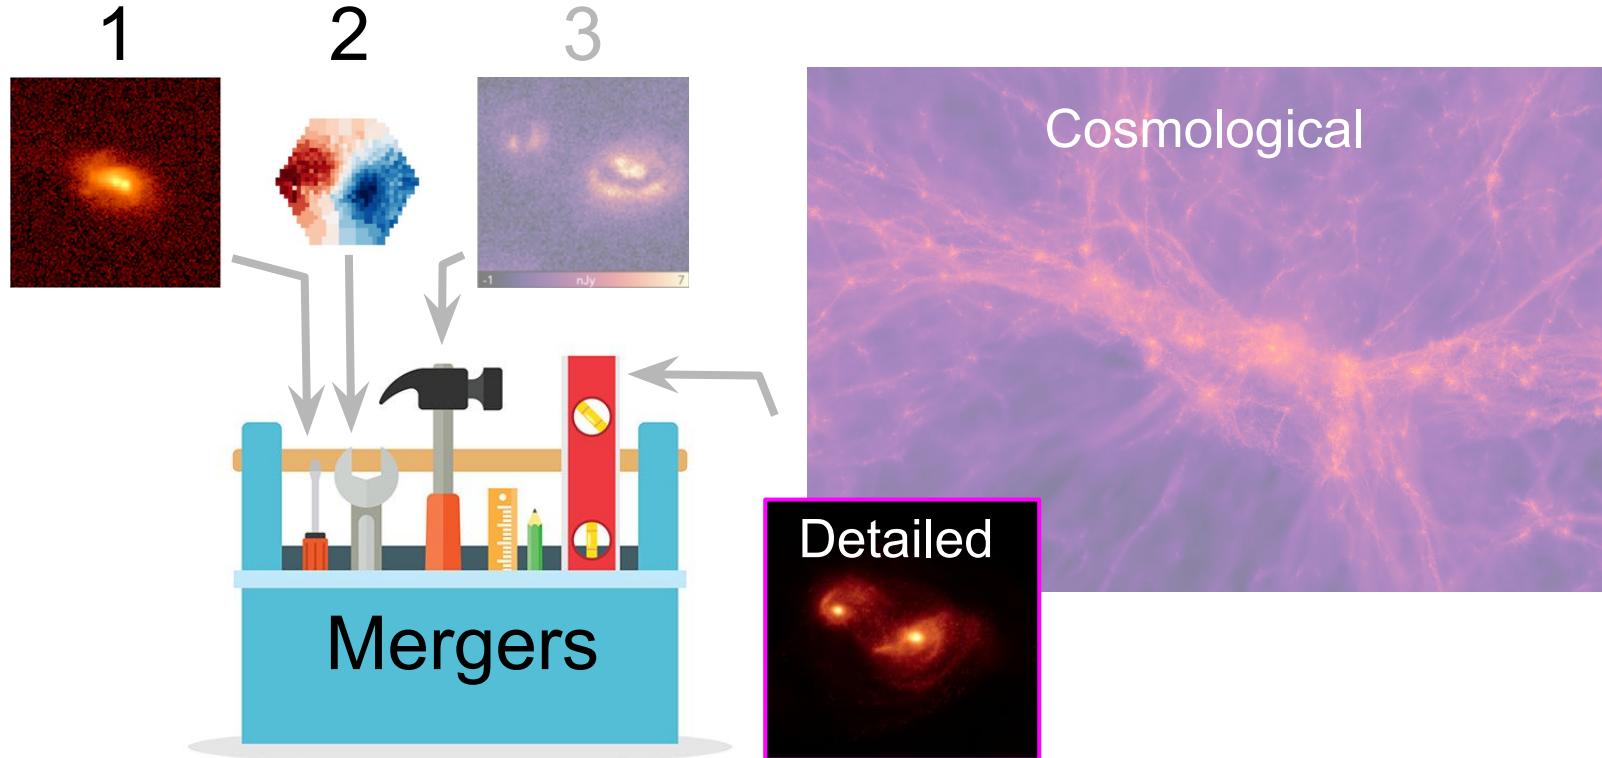

There are many different types and stages of mergers and they all look different observationally.

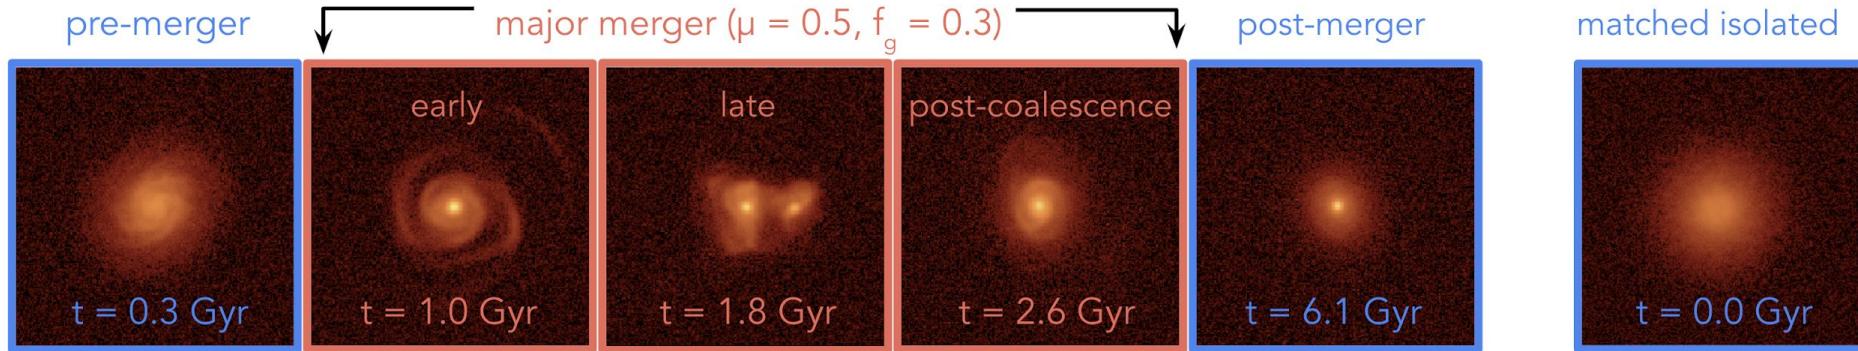

I approach better identifying mergers with the help of detailed hydro and cosmological simulations

I approach better identifying mergers with the help of detailed hydro and cosmological simulations

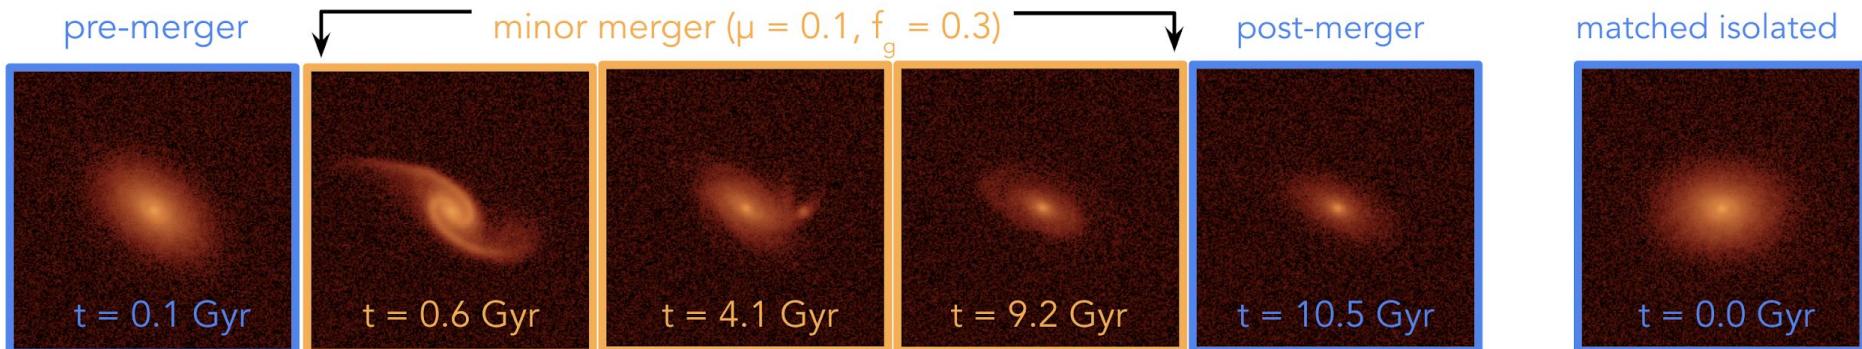

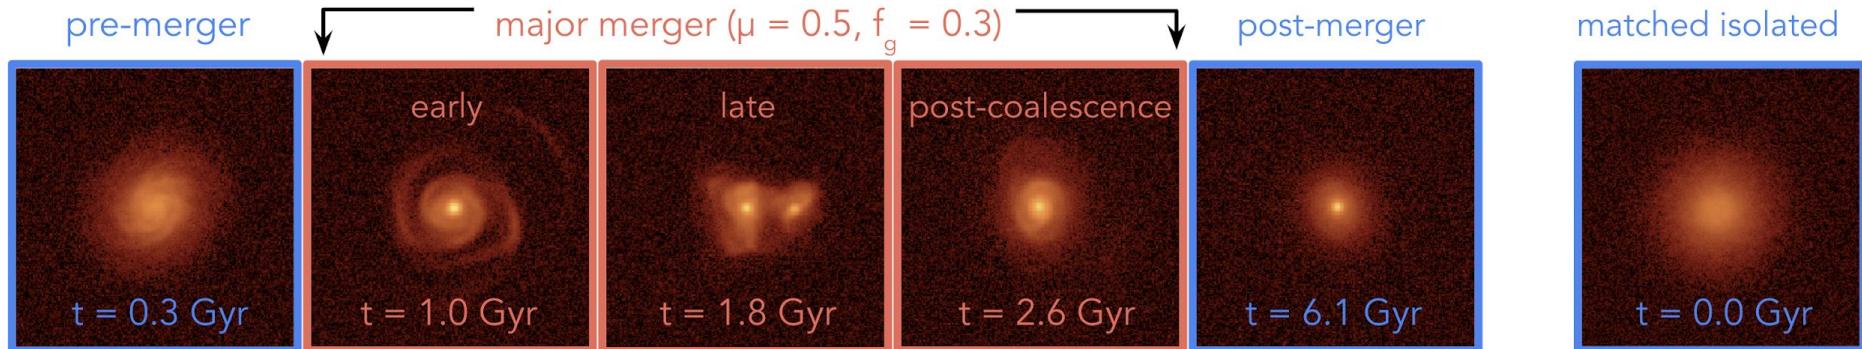

# Simulations of **merging** and **nonmerging** galaxies

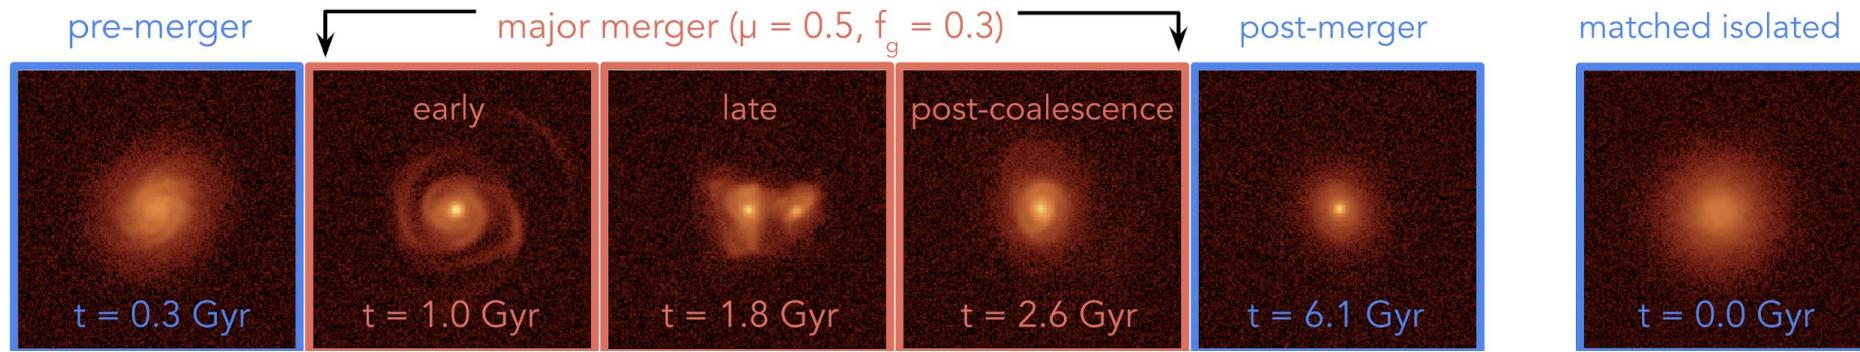

100s of snapshots per simulation  
x 5 simulations

GADGET-3 N-Body Simulations:  
Springel & Hernquist 2003,  
Springel 2005, Blecha+2018

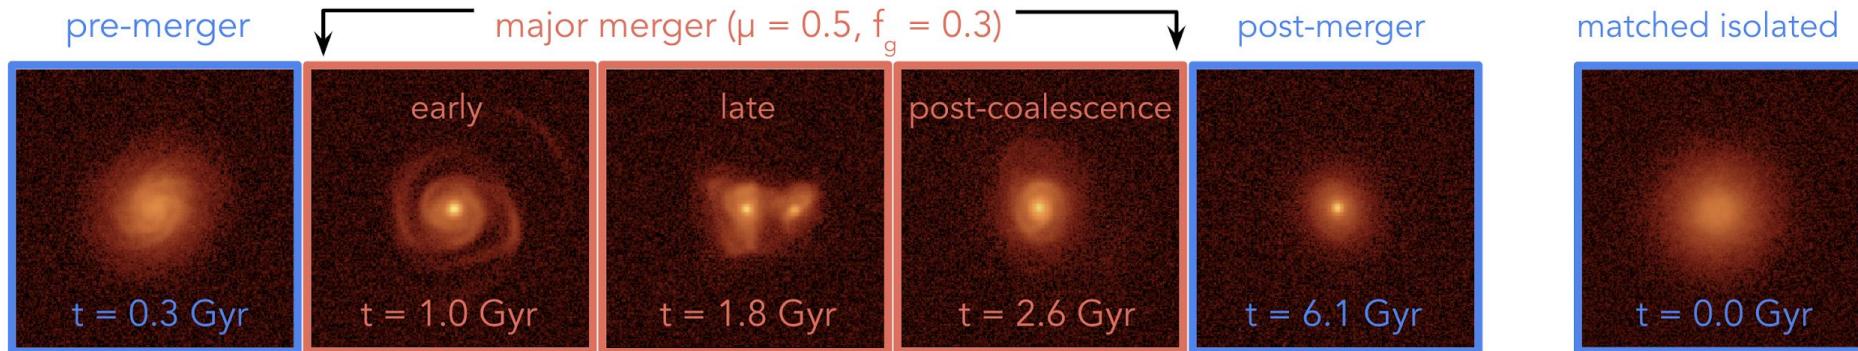

Major merger = more equal mass ratio, minor merger = unequal

# My pipeline creates mock Sloan Digital Sky Survey (SDSS) images and measures predictors

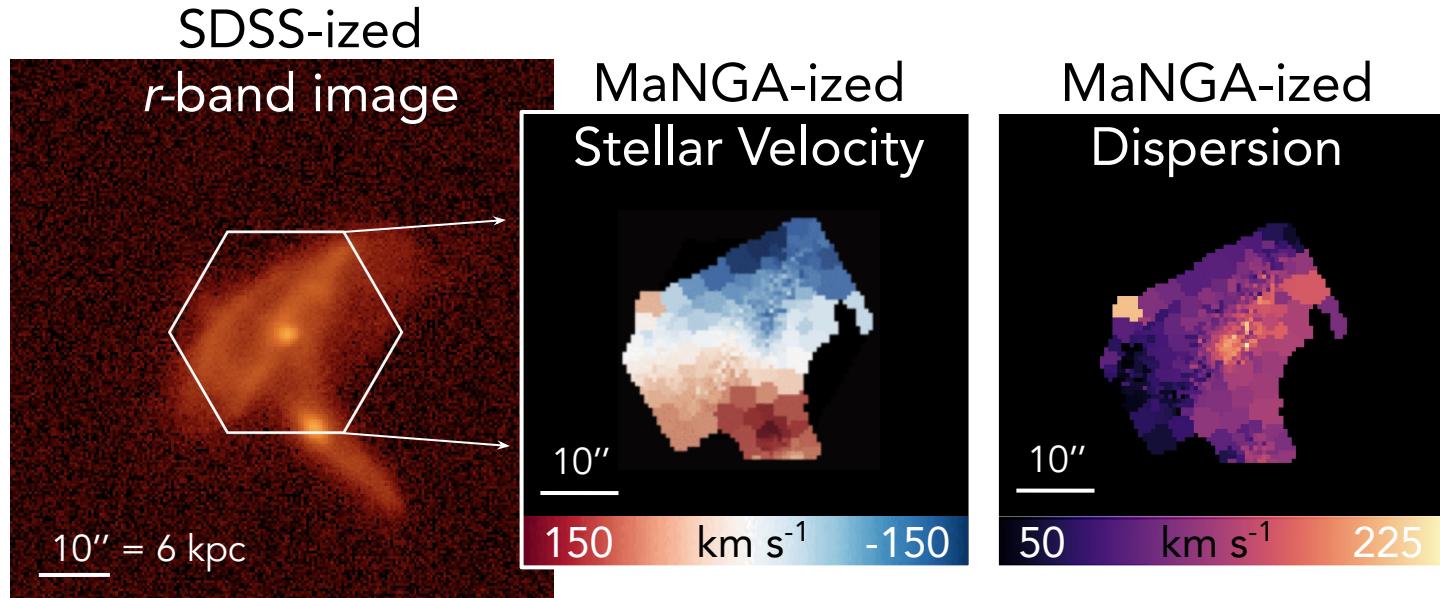

I combine all seven measured predictors using linear discriminant analysis (LDA)

The LDA is more accurate and precise than any of the individual predictors in identifying mergers.

It is also not a black box.

I create mock stellar kinematic maps to match the specifications of MaNGA integral field spectroscopy

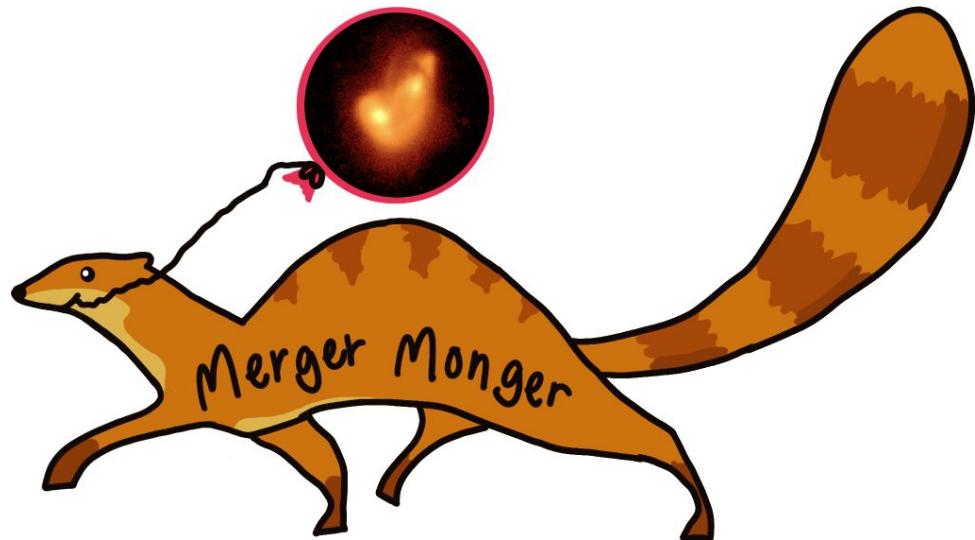

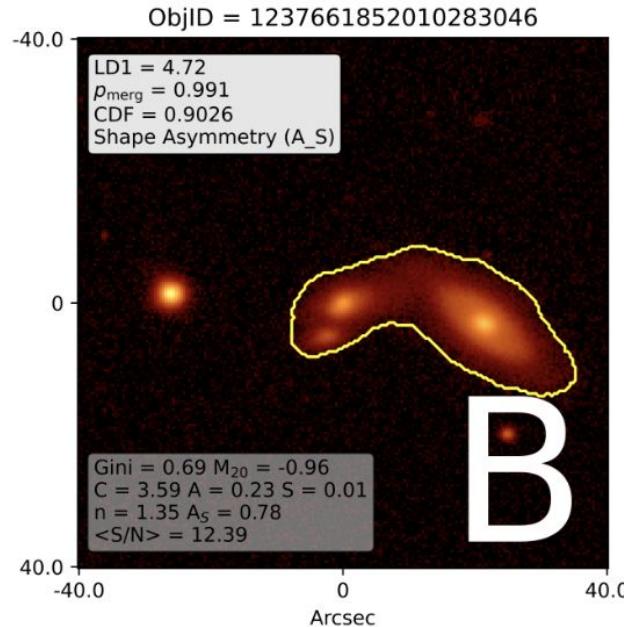

Nevin+2019

Nevin+2021

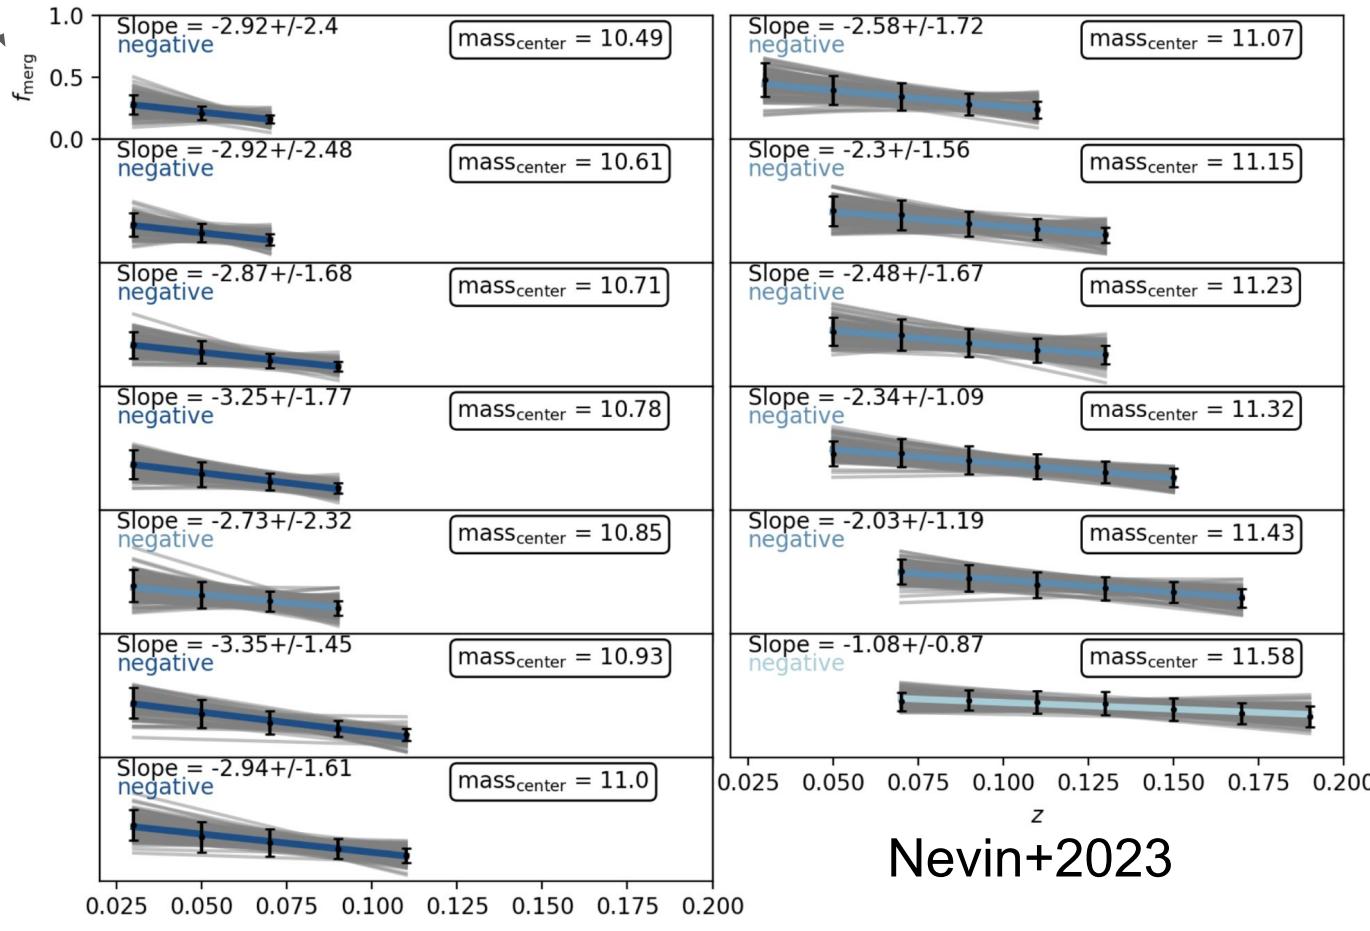

I measure predictor values and classify the ~1.3 million galaxies in SDSS using MergerMonger

[MergerMonger Github Repo](#)

# The major merger fraction decreases with redshift

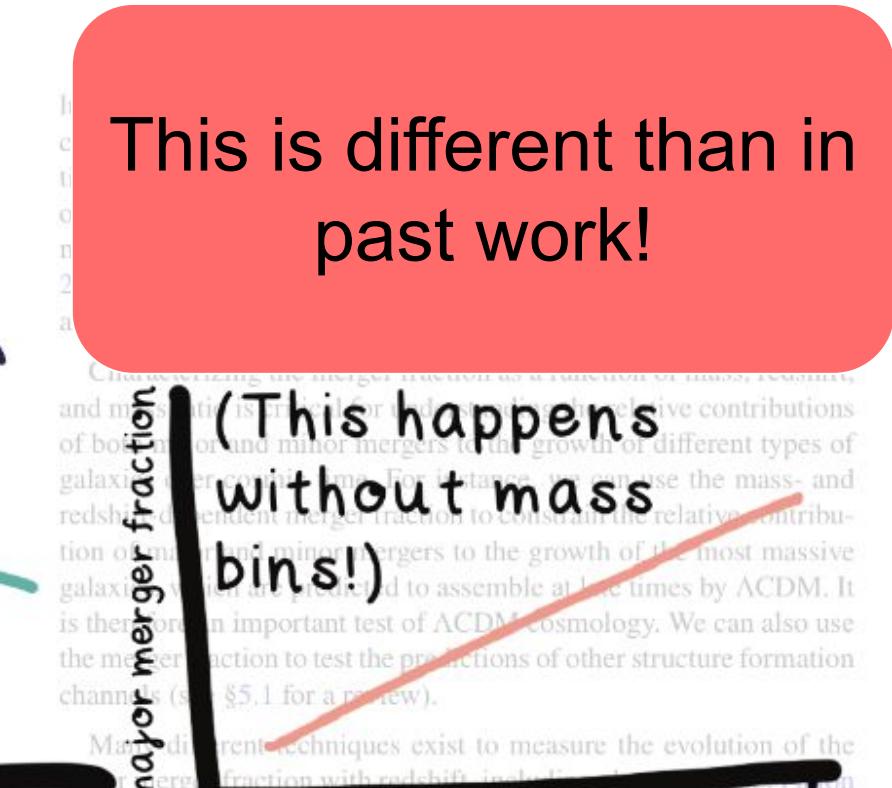

# The major merger fraction decreases with redshift

major merger fraction

## INTRODUCTION

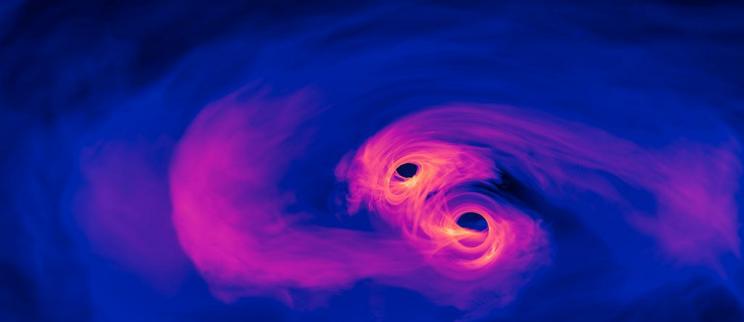

The  $\Lambda$ CDM model of structure growth predicts that galaxies grow hierarchically. However, the uncertainty still surrounds the impact of mergers on physical processes in galaxies. For instance, while theory predicts that mergers drive the growth of stellar haloes and elliptical galaxies (Springel 2000; Cox et al. 2008, triggered star formation (Di Matteo et al. 2008) and active galactic nuclei (GN, Di Matteo et al. 2005), and even quench star formation (Di Matteo et al. 2005; Hopkins et al. 2008), observational work often disagrees about the importance of mergers for driving these evolutionary processes (e.g., whether mergers trigger AGN and/or star formation, see Cisternas et al. 2017; Knapen et al. 2017; Eption et al. 2019; Pearson et al. 2019). This is a crucial tension: the implication is that our models and/or our current methods for identifying mergers are incorrect.

(This happens for all mass bins!)

# Merger fraction → merger rate as a function of galaxy and merger properties

NANOGrav 15-year dataset

SMBH gravitational wave background!

Joe Simon

Julie Comerford

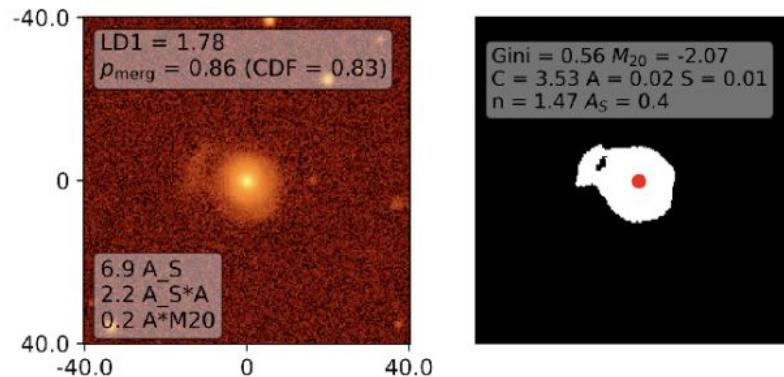

Simon+2023 in prep

My merger catalog has enabled multiple studies into the properties of merging galaxies and the AGN-merger connection:

Comerford+2023; An excess of AGNs triggered by galaxy mergers in MaNGA galaxies of mass  $10^{11} M_{\odot}$

[Hernández-Toledo+2023](#); MaNGA AGN have an enhanced merger fraction

[Negus+2023](#); Coronal line MaNGA galaxies

Fine-grained control over noise  
Its a model (  $\theta \leftarrow \rightarrow x$  )  
Its dynamic

# We are using simple benchmark datasets (like the pendulum) to build complex inference tools

Things we'd like to infer about a pendulum:

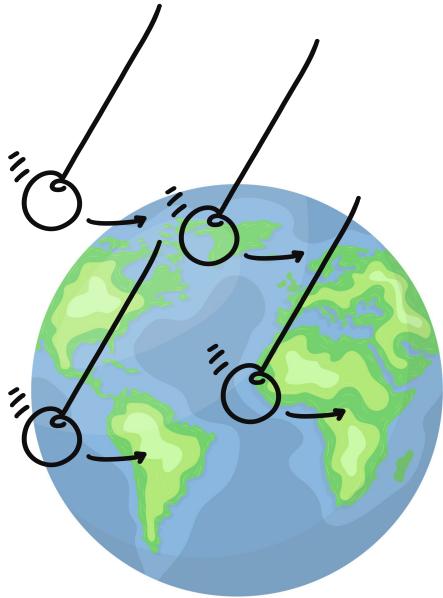

- starting angle
- mass
- length

Data:

position and momentum as a function of time  
(with added noise)

# But physics is not as simple as one experiment

EARTH

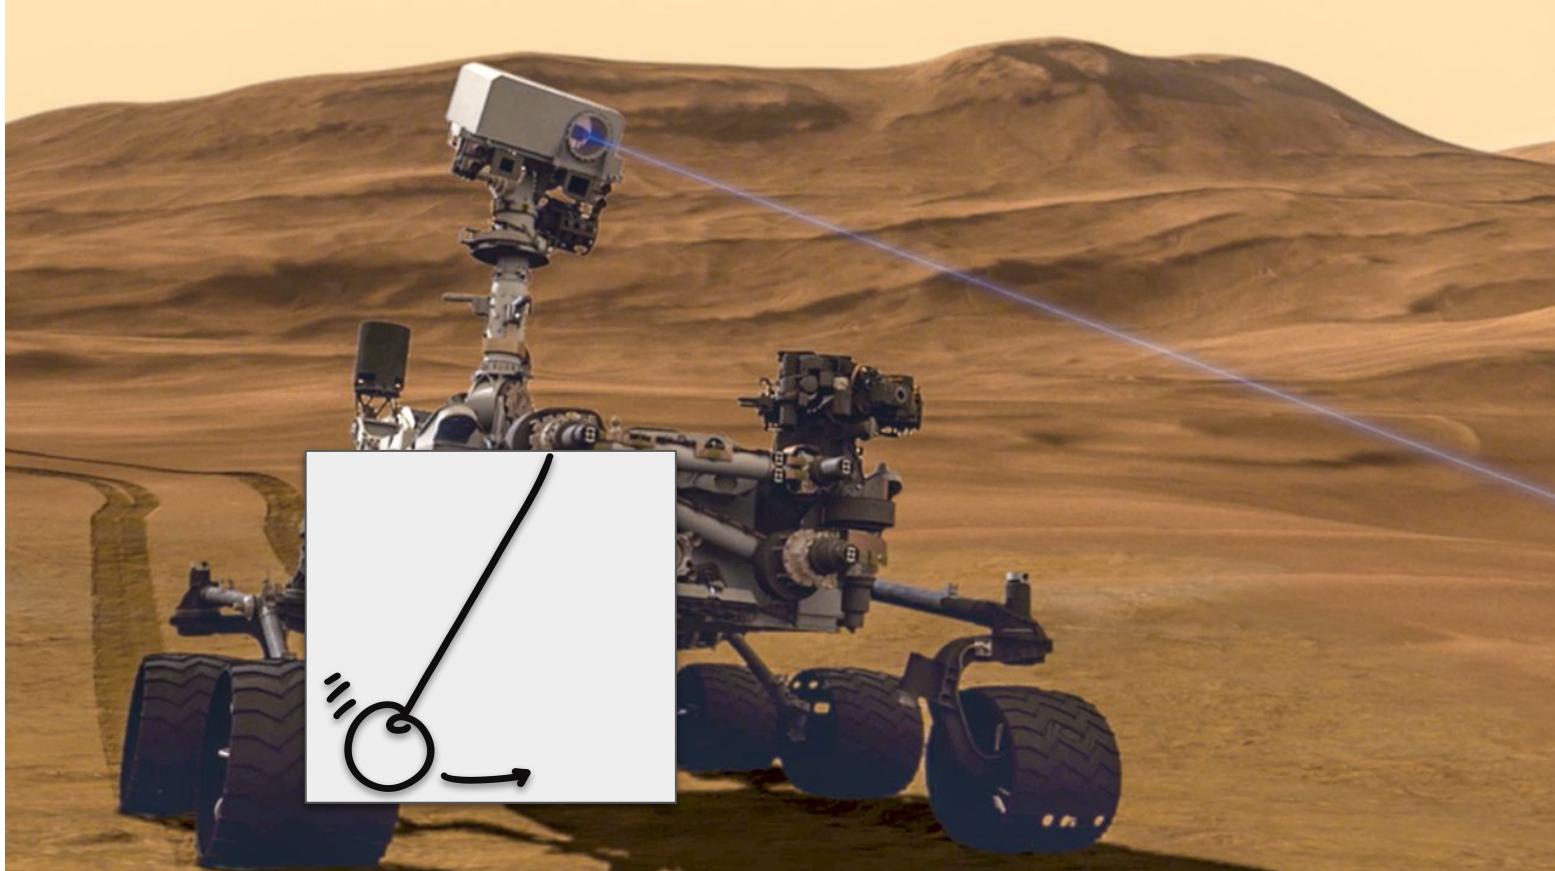

Things we'd like to infer about one pendulum:

- starting angle
- mass
- length

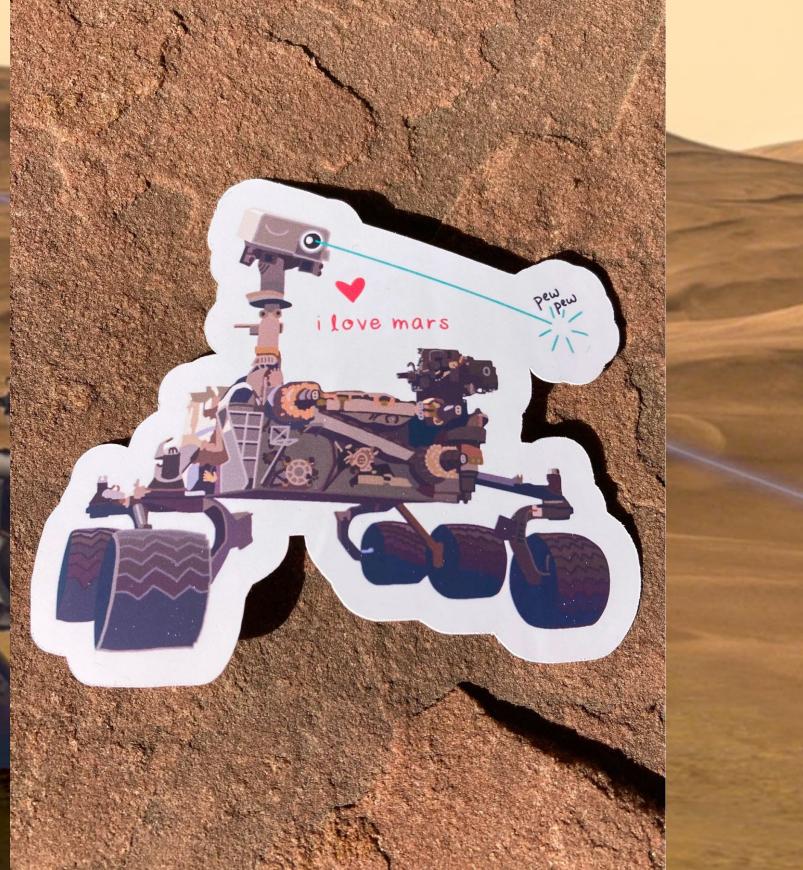

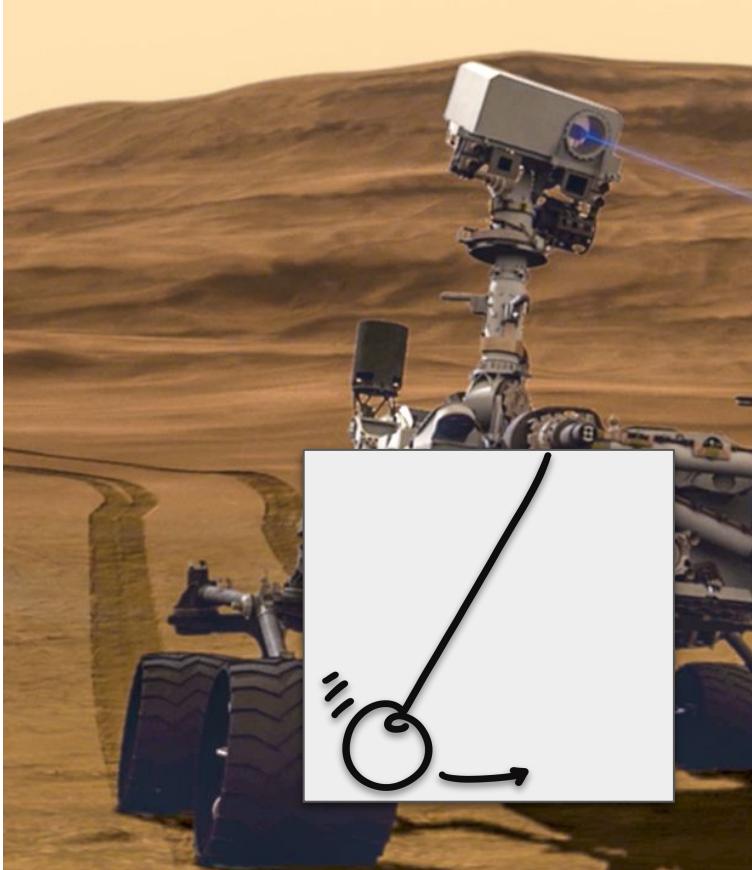

Things we'd like to infer using the ensemble of pendulums:

- acceleration due to gravity ( $a_g$ )

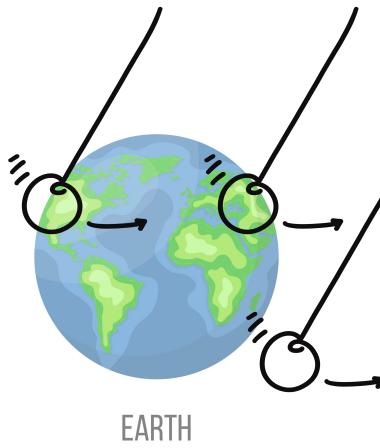

# Meanwhile, on Mars...

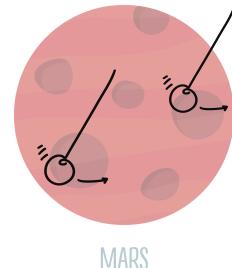

# Meanwhile, on Mars...

# There are many experiments with different conditions in different groups = hierarchical Bayesian inference

EARTH

MARS

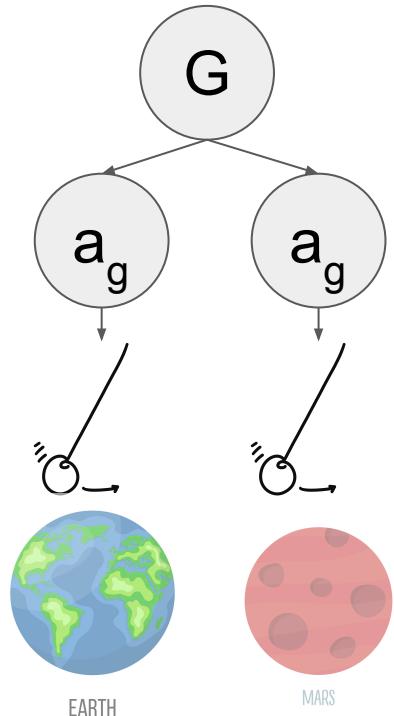

Things we'd like to infer about one pendulum:

- starting angle
- mass
- length

Things we'd like to infer using the ensemble of pendulums:

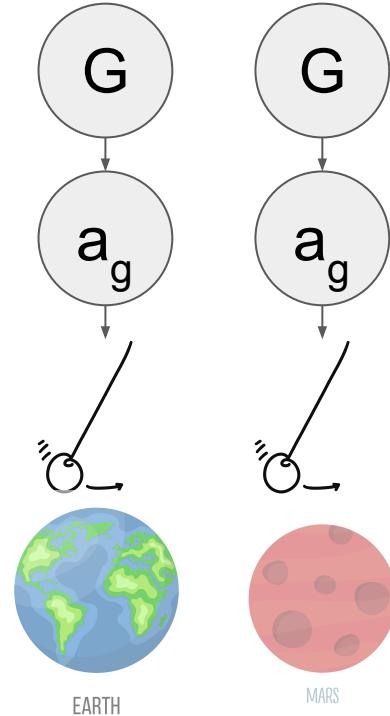

- acceleration due to gravity ( $a_g$ )
- Universal gravitational constant (G)

# Hierarchical Bayesian Inference is a powerful tool for lending inference power across layers of params

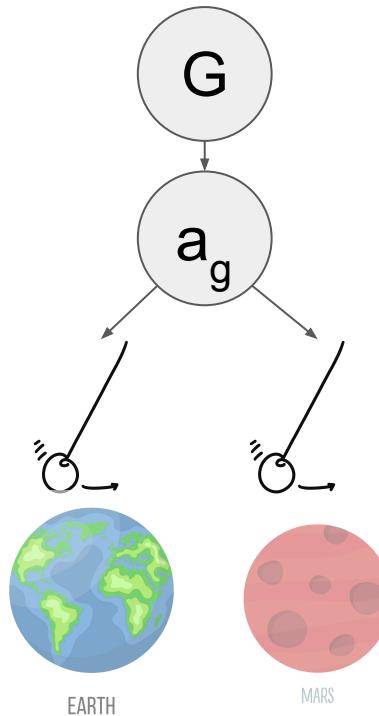

# Hierarchical Bayesian Inference is a powerful tool for lending inference power across layers of params

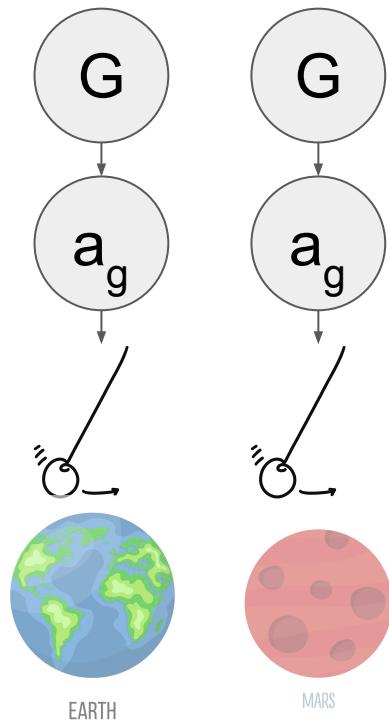

Independent / no pooling analysis

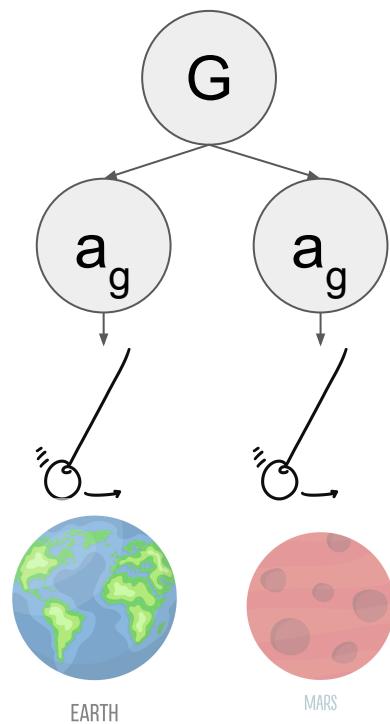

Co-dependent / full pooling analysis

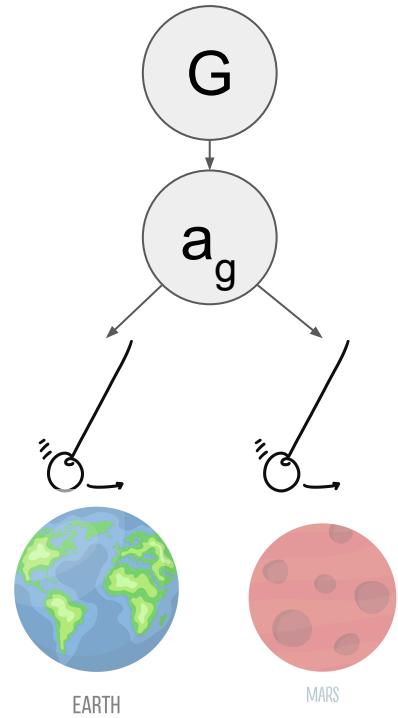

Independent /  
no pooling analysis

Hierarchical

Co-dependent /  
full pooling

# This system is essential for preparing a methodology for cosmological inference

Things we'd like to infer about one individual image:

- Lens parameters (ie Einstein radius)

Things we'd like to infer using the ensemble of pendulums:

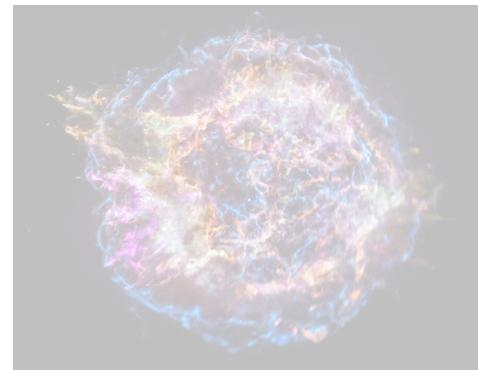

- Cosmological parameters ( $w_0$ )

UQ

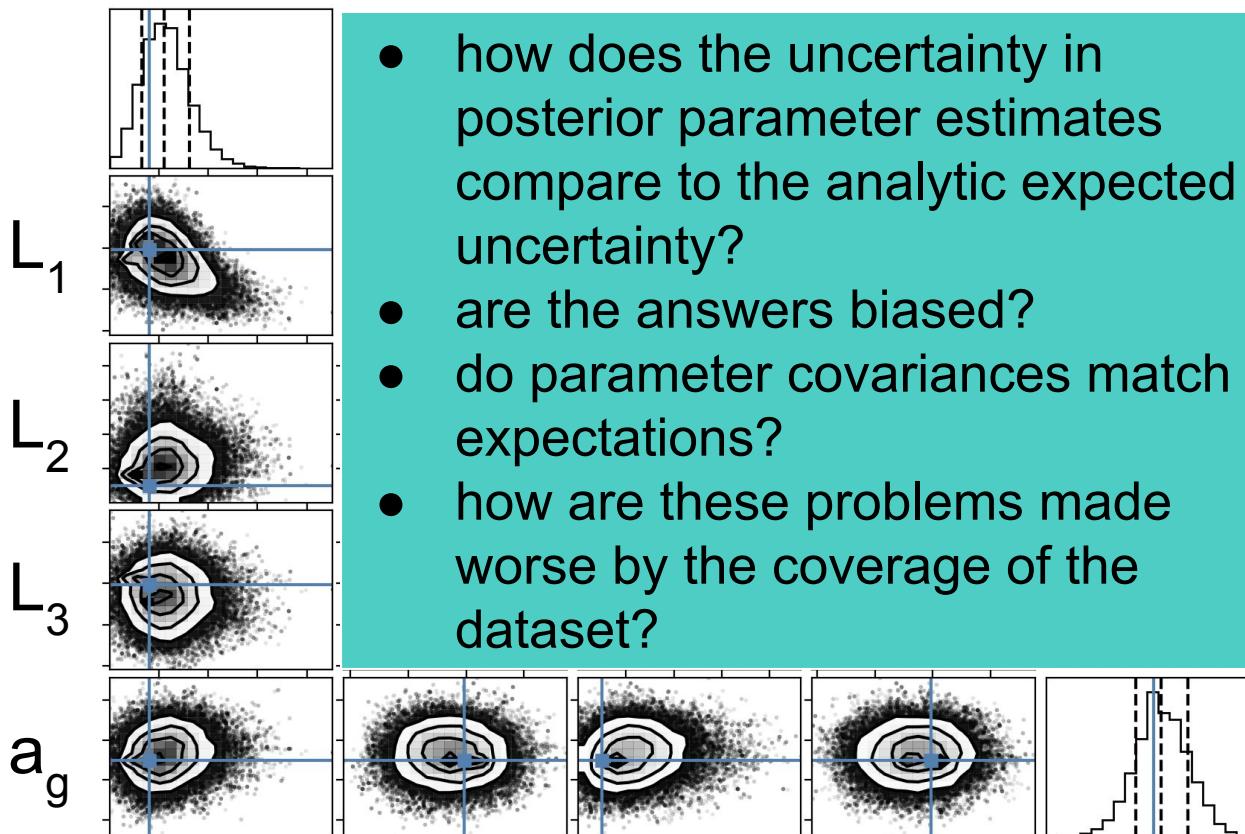

Hierarchical Inference

Goal: build a framework to quantify uncertainty in the parameter estimates

# Goal: build a framework to quantify uncertainty in the parameter estimates

- how does the uncertainty in posterior parameter estimates compare to the analytic expected uncertainty?
- are the answers biased?
- do parameter covariances match expectations?
- how are these problems made worse by the coverage of the dataset?

Use the UQ comparison and the tunable simulations to do a ***comparative analysis of inference methods***

Analytic errors from exact inference

Non-hierarchical sampling analysis  
No Pooling  
Full Pooling
